Develop a program to create reverse shell using TCP socket

Aim: To develop a program using TCP sockets to demonstrate the concept of a reverse shell, in which a client initiates a connections to a server and enables remote command interaction in a command interaction in a controlled laboratory environment.

Procedure:-

1. Import the required socket library for TCP communication.

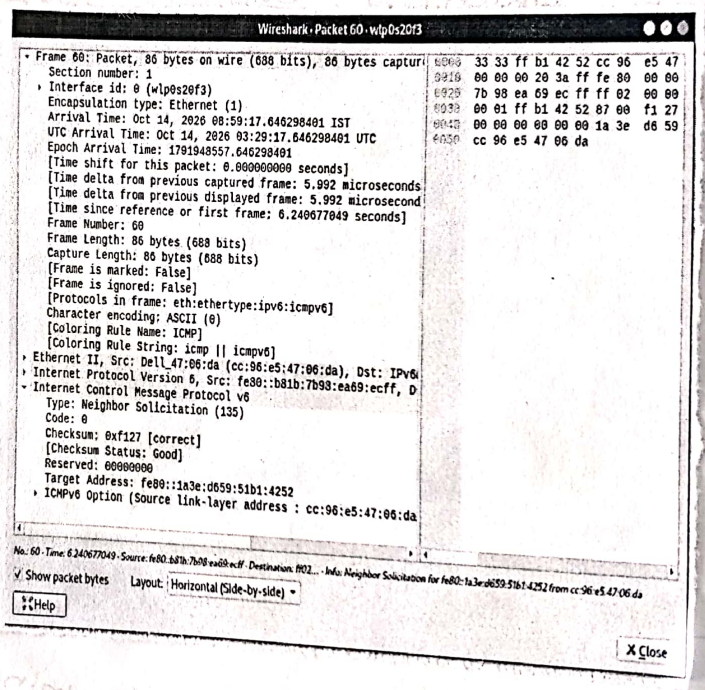

2. create a TCP socket using the appropriate socket functions.

3. configure the server with an IP address and port number.

4. Bind the socket to the specified IP address and port, and listen for incoming connections.

5. create a client socket and establish a TCP connection with the server.

Code:-

Step 1:- create the server

create a file named:

server.py

Use this sqje TCP server:.

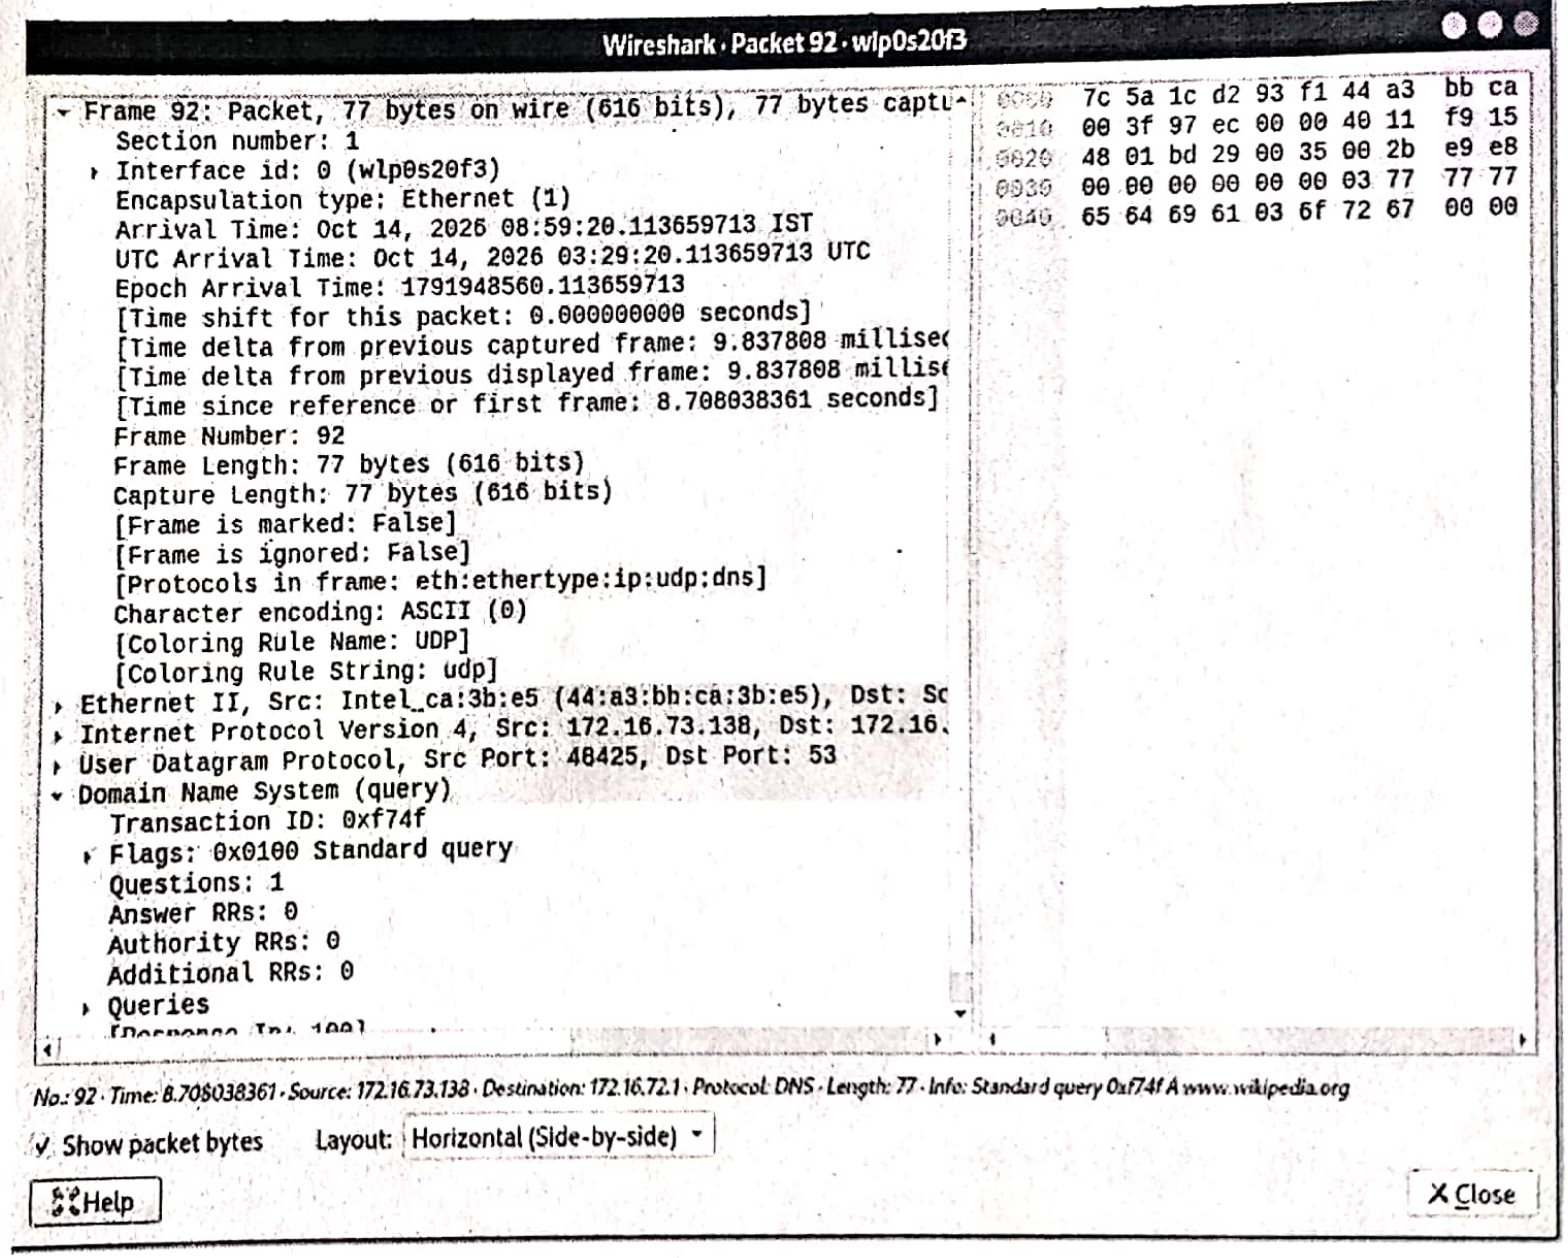

```
import socket
Host = '0.0.0.0'
PORT = 5000

Server = socket.socket (socket.AF_INET,
                        socket.SOCK_STREAM)
server.bind ((HOST,PORT))
server.listen (1)

print ("Waiting for connection ...")

conn, adar = server.accept()
print ("connected from :", addr)
while True:
    message = conn.recv (1024).decode ()
    if not message:
        break
    print ("client :", message)
    reply = "message received"
    conn.send (reply.encode())
conn.close()
server.close()
```

Step 2 : Create the client

create :

client.py

```
import socket
SERVER_IP = "127.0.0.1"
PORT = 5000
client = socket.socket(socket.AF_INET, socket.SOCK_STREAM)
client.connect((SERVER_IP, PORT))
client.close()
```

Step 3: Run the Server

open Terminal 1:

Python server.py

Step 4: Run the client

python client.py

Step 5:- Test multiple messages

Hello

Result:- The TCP socket connection is established, and two-way communication between the client and server is demonstrated.
